

## Flocculants

### KERAFLOC

One of the most important fundamental raw materials in the ceramic industry is **water**, which has now also become an **expensive resource**. Water is the **basis** for all **body and glaze compositions** and is also used for **cleaning** production equipment in factories. Water polluted with ceramic raw materials must be processed before being introduced into the effluent or waste system and additionally for further use in production processes, a **preliminary waste water cleaning** makes sense.

Under the name of **KERAFLOC** Zschimmer & Schwarz offers a series of flocculants which help to **separate the solids from water in a fast and neat manner**.
