

## Mould production Release agents

## TRENNEMULSION

Release agents are required for the manufacture of plaster moulds to bring about **good separation of the plaster negative cast from the master mould form**.

As these release agents from Zschimmer & Schwarz are **water-soluble emulsion systems**, the **absorbency of the plaster moulds will be unaffected**.

The release agents are **effectively spread** with various application techniques giving **good separating properties with a thin film thickness**. The thin film thickness guarantees that the **formation of the surface of the negative cast is not influenced**.
